

Fine Fiber
Technology

Fine Fiber Technology

By spraying cocoon-like ultra-fine fibers directly onto the skin, fine fiber technology provides light, soft, and natural ultra-thin films on the skin surface. This technology has the potential not only for cosmetics such as skin care and makeup but various fields.

In order to expand the possibilities of this technology, we are promoting open innovation and researching various treatment methods with beauty and medical professionals around the world.

Research on technology application for the skin care and makeup field
